Oat Variety Trial in Northeast Iowa

RFR-A1581

Brian Lang, extension agronomist Sarah Carlson, research coordinator Stefan Gailans, program manager Practical Farmers Ken Pecinovsky, farm superintendent

Introduction

Oats are a major spring-sown, small grain crop in Iowa. Oats can be used for grain and straw production, as a companion crop to establish hay and pastures, or for early-season forage as hay or haylage. Because oats mature in late July to early August, it allows for cropping options for the remainder of the season, including establishment of a perennial forage or cover crop, and timely window for a mid-season animal manure application.

Careful management and proper choice of variety can make oats a profitable crop due to their low input requirements and favorable effects on succeeding crops in a rotation. Planting oats before April 15 is recommended for optimal yields in Iowa. This helps avoid exposure to warmer weather during grain fill.

Test weight is the most commonly used indicator of grain quality. High test-weight varieties should be chosen by growers who intend to market oat grain. Grain quality components such as beta glucans and fat also are gaining importance by food processors. Beta glucans are noteworthy for positive effects on human health. Lower fat concentration in grain tends to store better, reducing the potential for grain rancidity.

Oat growth is regularly affected by rust and barley yellow dwarf virus. Variety resistance to these diseases should be considered. Another option is the use of a foliar fungicide applied at Feekes 9 growth stage, defined as flag leaf emerged with ligule visible. A separate oat trial was conducted this season to compare the use of a foliar fungicide.

Materials and Methods

Sixteen oat varieties were tested in 2015. The soils at the site consist of 83B Kenyon loam and 198B Floyd loam. The site was in soybeans the previous year and has been in a corn-soybean crop rotation for over 20 years. The site was fertilized with 18 lb N/acre and 35 lb K₂O/acre to meet optimal soil test levels based on ISU soil fertility recommendations.

The site was field cultivated once before planting on April 1. The planter was a John Deere BD1108 drill with 7.5-in. row spacing planted at a rate of four bushels/acre followed by one pass with a cultipacker. Each plot of a variety occupied 553 sq ft and there were three replications. The trial was sufficiently weed-free to not require the use of herbicides or hand weeding.

The trial was harvested July 23 with a JD4420 combine with Weigh-Tronix load cells on weigh bin. Subsamples of grain were analyzed by General Mills for percent groats, plump groats, beta glucans, and fat.

Straw yields were determined from 8.125-ft wide by 20-ft long windrows from the center of each plot. Subsamples were collected and dried for percent dry matter determination.

The 2015 season provided normal growing degree days and precipitation (Table 1).

Results and Discussion

Variety trial results for 2015 are presented in Table 3. Yields reported are on a 32 lb/bushel basis. Test weight is the most important indicator of grain milling quality. Minimum

test weights are 36 lb/bushel for U.S. No. 1 oats, and 33 lb/bushel for U.S. No. 2 oats.

Some of the grain quality components are included in Table 3. Higher concentrations of groats, plump groats, and beta glucans, and lower concentrations of fat are more favorable to the oat food processing companies.

Yield results from a single year are not reliable predictors of next year's yield. Environment and disease conditions can

Table 1. Rainfall and oat growing degree days (GDD) for 2015 and the long-term normal.

| | Rainfa | all, in. | GDD, base 32°F | | | | |
|-------|--------|----------|----------------|--------|--|--|--|
| Month | 2015 | Normal | 2015 | Normal | | | |
| April | 4.3 | 3.8 | 519 | 498 | | | |
| May | 3.5 | 4.4 | 867 | 823 | | | |
| June | 5.8 | 5.3 | 1,099 | 1,098 | | | |
| July | 4.0 | 4.7 | 1,185 | 1,250 | | | |
| Total | 17.6 | 18.2 | 3,670 | 3,669 | | | |

fluctuate greatly from year to year, so it is important to consider yields averaged over multiple years. Table 4 provides a summary of yield and test weight for varieties in trials conducted from 2011-2015.
