Objective: Determine the effect on winter triticale yields and economics resulting from two seeding rates.

Farmer-cooperator will:
- Take photos throughout the project.
- Keep in contact with PFI with updates and questions.
- Fall 2015, establish a minimum of 5 replications as shown in the diagram below with randomized and replicated strips of winter triticale planted at two rates:
  - 85 lb/ac
  - 135 lb/ac
- Strips will be 30 feet wide and run the length of the field.
- Spring 2016, conduct stand counts in strips after triticale green up.
- Summer 2016, harvest triticale in strips, record yield of each strip.
- Turn in data to Practical Farmers of Iowa at the end of project.

Practical Farmers of Iowa will:
- Help set up monitoring protocol, monitor progress of project and provide support when needed
- Publish results in a PFI research report, on PFI website, and potentially other outlets
- Provide $550 compensation at conclusion of the project in 2016
