Terminating Cover Crop Twin Rows After Planting Corn

**Objective:** Determine if a cover crop, when planted in twin-rows on 30-in. centers, can be terminated after the time of corn planting without causing corn yield drag.

**Farmer-cooperator will:**
- Take photos throughout the project and keep in contact with PFI with updates and questions.
- Fall 2017, seed oat + cereal rye cover crop in 8-in. twin rows on 30-in. centers.
- Spring 2018, establish at least 4 replications as shown in the diagram below of two treatments:
  - Cover crop terminated 14-21 days after planting (DAP) corn
  - Cover crop terminated the day of planting corn
- Strips will be as wide as at least one combine pass and run the length of the field.
- Collect aboveground biomass samples of cover crop from strips just prior to termination.
- Plant corn to all strips on the same day.
- Allow Dr. Alison Robertson’s team to sample corn seedlings for disease prevalence.
- Summer 2018, work with Theo Gunther at Iowa Soybean Association to coordinate soil sampling.
- Allow Dr. Robertson’s team to sample mature corn plants for stalk disease prevalence.
- Fall 2018, harvest corn from strips individually.
- Turn in all info and data pertinent to this trial to Practical Farmers of Iowa by the end of the project.

**Practical Farmers of Iowa will:**
- Help coordinate with Dr. Robertson (ISU) and Theo Gunther (ISA).
- Help set up monitoring protocol, monitor progress of project and provide support when needed.
- Publish results in a PFI research report, on PFI website and potentially other outlets.
- Provide $550 compensation when yield data is submitted at conclusion of the project in 2018.
